eMobility Infrastructure

## Charging stations for your e-mobility

e-ChargingStation

e-ParkingSystem

e-Wallbox

PedelecChargingSystem

Everything from  
a single source!

## e-ChargingStation

Our unmistakable design creates the link to the topic of e-mobility in the form of a synapse in the power grid, as the upper part of the charging point! The form of charging point is classic and creative. As new important city furniture for the future of e-mobility. The outer shell of our products is made of a special concrete, making it particularly environmentally friendly and robust. For this we stand for safety and a reliable quality.

### e-ChargingStationBasic

Small budget? The good does not necessarily have to be expensive, prove the products of the category basic, which remain affordable despite their excellent quality. The basic e-charging station can be extended to the premium at any time.

This guarantees the conditions for a non-discriminatory and barrier-free loading according to the European Standard mode 3 and a mode 3 automatic locking during the charging process.

### e-ChargingStationPremium

People know exactly what it's all about. We also know the requirements of people who have an e-car and/or charging infrastructure ready. Our premium products offer what the discerning person demands: professional PLUG'n CHARGE quality for the highest demands in terms of function and usability. The premium Station is prepared for loading in the system. This includes our control Panel including the possibility of data communication.

Online monitoring, billing, access control? No problem!

## e-ParkingSystem

The e-parking system consists of three separate charging stations, which are visually and technically connected to a parking system, which is quickly the first e-parking occupied! With the e-parking system of the PLUG'n CHARGE you follow the development of e-mobility: - from simple charging - to charging in the system (intelligent charging)

The PLUG'n CHARGE stations are made of special concrete with a standardized interface. The vehicle owner can connect his own plug (type 2 or adapter).

### PedelecChargingSystem (4 Chargingpoints)

For PLUG'n CHARGE, e-mobility is both the e-car and the pedelec. With charging stations for pedelecs and e-bikes, PLUG'n CHARGE remains the pioneer in this market segment: for example, in terms of usability in handling the charger. For this PLUG'n CHARGE offers a KEYLESS operability that is unique on the market. The function is available to users and operators of the charging station for pedelecs at any time mobile and of course free!

## e-Wallbox

We at PLUG'n CHARGE have accepted the challenge: Our e-wallbox is made of special concrete with a smooth surface! The Wallbox is admired for that. Made of raw materials, with inspiration and passion. The technology behind it is German industry standard, tried and tested a thousand times.

Plug in, load, DONE!

### e-Wallbox Basic cable

The e-Wallbox Basic of PLUG'n CHARGE is graceful, firm and recognizable. The technical components are integrated in the inner housing. They are equipped with a charging cable IEC type 2 according to VDE-AR-E 2623-2-2. The control of the charging current according to IEC 61851 or VDE-AR-E 2623-2-2 is ensured by the charging controller.

Of course, there is the e-wallbox with a charging socket instead of the plug. Then with a power failure plug release. And of course as a premium version for loading in the system with access control, system monitoring and billing.
